Delivering fingertip knowledge to enable service life performance specification of wood

Ed Suttie, BRE Ed.Suttie@bregroup.com

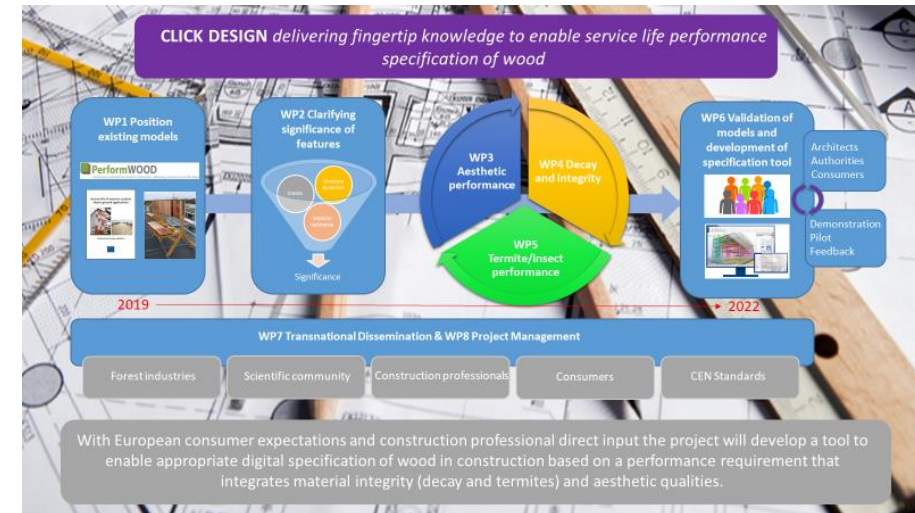

- Struggle to answer questions about durability and performance of wood products
- Disadvantage for timber compared to steel, aluminium, plastic and concrete
- Building Information Modelling (BIM) and life cycle analysis (LCA) include service life data

- A software tool for architects and specifiers to enable performance specification for wood
- From the complex, fragmented and general to the easy-to-use, consolidated and specific in an accessible digital tool
- March 2019 to February 2022

WP1 Position and existing models

- Surveyed and critically reviewed existing models to identify strengths and weaknesses
- Comparative evaluation of models based on: hygrothermal properties, biophysical decay, material resistance, and engineering design.
- Comparison of availability of input data, consistency of variables, transferability of output data to superior modelling levels and their accuracy, reliability and reproducibility is being made and information lacking identified

PerformWOOD

Service life of wood in outdoor above ground applications

Engineering design guideline

WP2 Clarifying significance of 'missing' features

- Investigate features missing from existing models that potentially have a significant impact on performance
- Approaches to fill the gaps using laboratory and field trials: cracks, weathered material, material resistance and adaptability to in-ground situation
- Product performance is being assessed against real performance and failure data in existing databases.

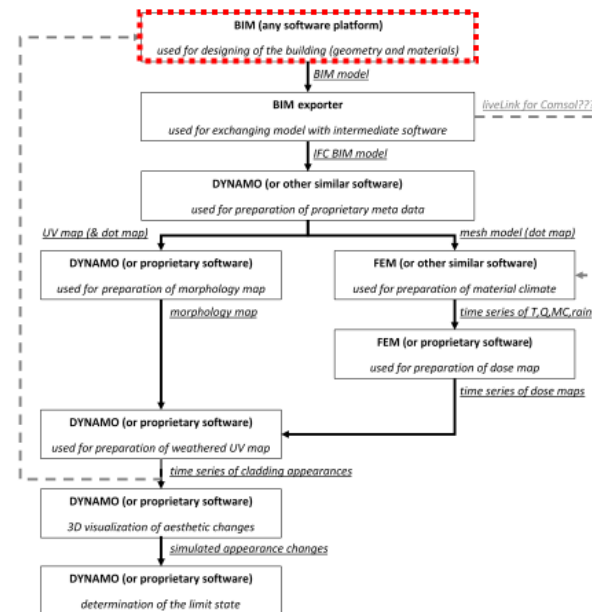

WP3 Aesthetic performance of building

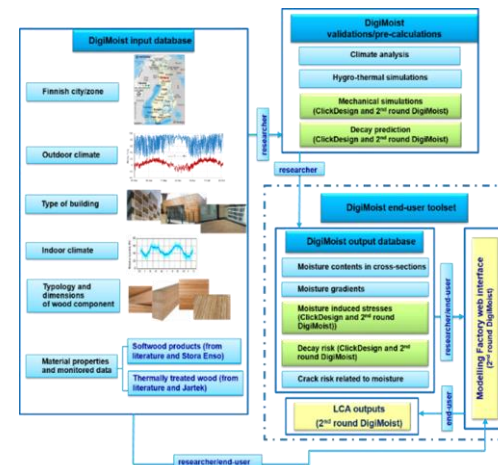

- Quantify appearance changes of wood surfaces and the definition of aesthetic limit states
- Integration into BIM
- Develop a novel methodology for combining multi-sensor data (including colour, texture, gloss, roughness) into a single model indicator expressing customer perception ‘satisfaction with appearance’

BIM implementation

- Understand the effect of fungal decay on strength and stiffness of timber structure
- Experimental studies on the spatial distribution of decay in timber under laboratory conditions
- Finite element analyses to predict distribution of moisture, temperature and relative humidity inside wood as well as moisture gradients across sections including under sub-freezing temperatures and eventual presence of free water in wood, wind velocity, solar radiation and shading

Pre-stressed glulam slabs

WP5 A measure of termite and insect performance

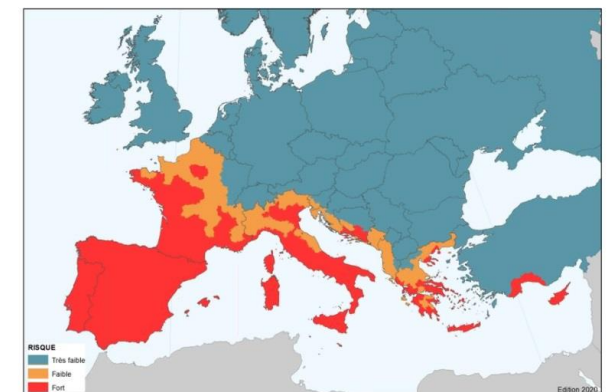

- Study the adaptability of existing models to create a measure of insect/termite performance to contribute to the model
- Identify parameters influencing the insect risk, such as climate, moisture, accessibility for termites, study of the performance of selected model construction materials against subterranean termites
- Conduct reality checks of the performance measures

Anobids

*Hyloterpes
bajulus*

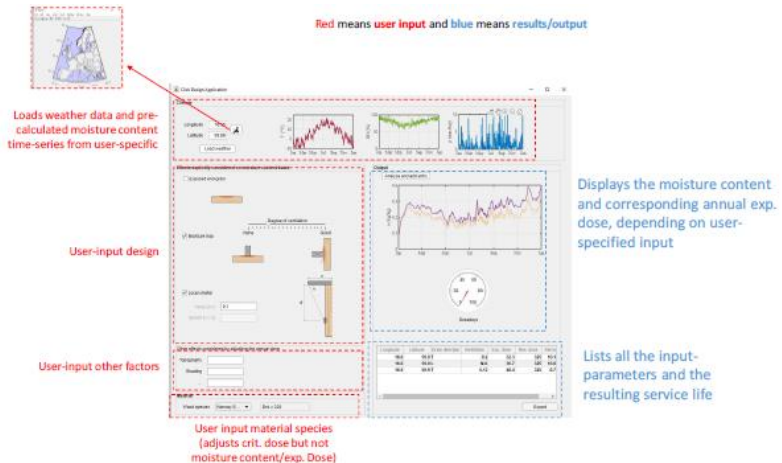

termites

RISQUE
Très faible
Faible
Fort

WP6 Validation of models & development of specification tool

- Develop numerical models on the basis of the results of the previous WPs
- A set of models will be validated against real-case studies from across Europe
- Validation of the most promising set of performance models under different scenarios to predict the performance of timber structures and products
- Development of the CLICK DESIGN tool

ForestValue

Delivering fingertip knowledge to enable service life performance specification of wood

Project Coordinator
Dr Ed Suttie, BRE, UK
Ed.Suttie@bre.co.uk

The CLICKdesign project is developing a performance based specification protocol to enable a software tool for architects, specifiers and the public to embed service life performance specification for wood. This will help increase market confidence with users for selecting wood as a reliable product and enhance an optimised performance of timber in the built environment.

PROJECT CLICKDESIGN

PERFORMANCE BASED SPECIFICATION OF WOOD

Expected results

Expected results

Decay, insect and aesthetics

Construction

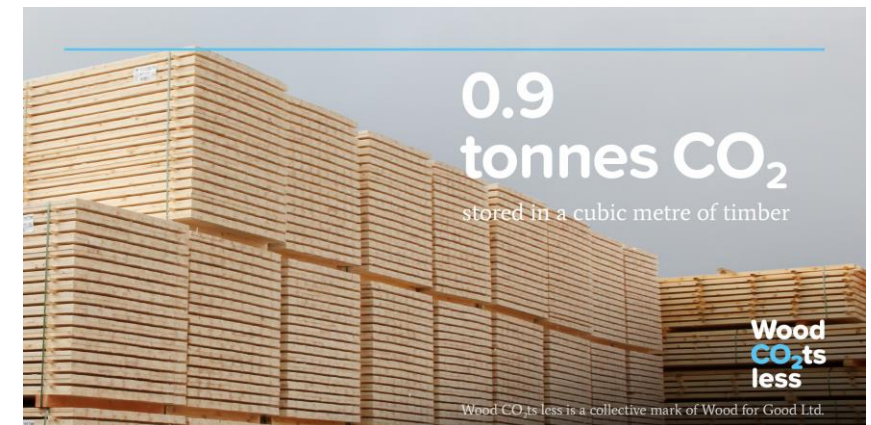

Validation

- Collaboration and creative problem solving
- Team availability altered
- Postponed researcher exchanges
- We find solutions and work around the problem
- March 2019 to February 2022 – possible to extend to April 2020

19 tonnes CO₂

- **Piloting the tool** with professional bodies and improving it 2021 workshops
- Increasing influence on **standardisation** work and CEN committees especially CEN/TC38 WG28 *Performance Classification of wood*
- More support for **young researchers** - in the first year CLICKdesign has already supported 14 students in their Bachelors, Masters and Doctoral studies, providing opportunity for young researchers
